

Week 12

Revision

Overview

Welcome to the final Week 12 of Spatial Analysis.

This week is devoted to the revision. We briefly recall:

- Main broad topics covered in the subject
- Main R packages used for spatial analysis and visualisation
- Main data sets used in the workshops and home assignments

You can use these materials as the subject syllabus in the future.

Also, we will discuss:

- Main types of questions in the final exam
- General rules and requirements for the final exam

Finally, we will browse and discuss questions in the sample exam on the LMS. This sample exam will not be marked. Its main aim is to show you how the final online exam looks like and works.

Before your final exam, please browse the revision files on the LMS. Please ensure that you know how to install R packages and load datasets in R. It is important as some PCs in the university computer labs, which will be used for the final exam, may not have all the necessary R packages installed.

During the revision workshops, the students will be able to ask their remaining questions about the subject materials and the final exam.
